PHILOSOPHY

Traditionally excess kinetic energy was dissipated through friction or a braking device (mechanical or electrical), most commonly a braking resistor. This unused energy now has a valuable potential. Using a regenerative unit the generated energy can be feedback in the DC circuit through the drive or it's possible to feed it back onto the mains power supply line.

COMBIVERT R6 regen units are able to supply and feedback energy of a single inverter or a common DC-link of several drive controllers. The system can also be designed to match the required power by the cascading of several units.

COMBIVERT R6

SAVING ENERGY THROUGH REGENERATION - AN ENVIRONMENTAL CONTRIBUTION THAT PAYS OFF!

PASSENGER AND FREIGHT ELEVATORS

- replacement of traditional braking resistors
- reduced fire hazard of the system
- return on investment through energy savings possible after less than 2 years of operating time

CONNECTION OF GENERATORS TO UTILITY SYSTEM

- power quality standards (e.g.: IEEE-519 / THDi < 8 %) can be met with harmonic filters
 - combustion engines
 - wind energy plants
 - hydropower plants

ECCENTRIC LOADS

- increased efficiency of variable speed drives with changing kinetic and regenerative load cycles

THEATRE TECHNOLOGY

- no heating of resistors
- energy optimization
- low-noise braking operation

LIFTING AND CONVEYOR / STORAGE RETRIEVAL SYSTEMS

- DC-interconnected operation of multiple drives support energy sharing
- return of peak energy into the mains line power supply
- no additional heat sources

TEST BENCHES AND TEST SYSTEMS

- permanent regeneration of energy
- can be cascaded for large loads

CENTRIFUGES

- regenerative braking of high centrifugal masses
- utilization of kinetic energy
- increased productivity due to short start-up and run-down times

BENEFITS

- Easy replacement for braking resistors
- Usable for all common supply voltages of 180 ... 528 V AC, 50/60 Hz
- Compatible with all typical DC - powered drive controller
- Integrated pre-charging circuit
- Compact and lightweight devices
- Wide power range up to 1.000 kVA
- Cascadable power parts
- Optional choke or harmonic filter
- Reduced fire risk in sensitive areas
- Reduced cooling requirements of the environment
- Energy meter for the validated savings
- freely configurable inputs and outputs
- Various field bus interfaces available by operator

COMBIVERT R6 -FUNCTIONALITY

SIMPLIFIED DIAGRAM

WITH COMMUTATION CHOKE

With **COMBILINE** harmonic filters the **R6 - System** generates sinusoidal current at the mains line power supply.

WITH HARMONIC FILTER

The COMBIVERT R6 can regenerate energy from drive controllers back onto the mains power supply line. This can be from a single drive controller or from a common DC-link of several inverters.

In supply mode the COMBIVERT R6 pre-charges the DC-link and acts like a typical B6 rectifier. The DC-link voltage corresponds to the rectified AC supply voltage.

When the energy fed into the DC-link by one or several drives in a deceleration or braking operation the regen unit will feed this excess energy back to the mains power supply line enabling access to this energy by other consumers on the grid

Depending on the system design either standard chokes or harmonic filters can be used to improve the THDi (lower harmonics).

With standard COMBILINE mains chokes all industrial requirements are fulfilled (block shaped regeneration). Using the COMBILINE harmonic filters will result in nearby sinusoidal current waveform for supplying and regenerating energy (THDi typ. < 8%)

VOLTAGE / CURRENT DIAGRAM FOR REGENERATIVE OPERATION WITH R6-NCM

Voltage
Current with harmonic filter
Current with mains filter

Next to the established control version R6-S the modulation scheme was improved with the "Natural Current Modulation". This new R6-NCM technology is available with the new control Type, called "N-version"

The Natural Current Modulation principle emulates the current waveform of a typical B6 rectifier system also in regeneration mode. This results in a much smoother commutation and an additional synchronization module (as used with R6-S) is no longer required.

THE ESSENTIALLY ADVANTAGES OF R6-NCM

- Reduced noise level in regen mode
- Improved current waveforms (reduced THDi values)
- Standard mains chokes and patented harmonic filters of the KEB COMBILINE Z1 series can be used
- No additional synchronization unit needed
